

DHCP Basics

(Dynamic Host Configuration Protocol)

BUPT/QMUL
2013-04-01

Electronic Engineering

Topics In This Course

Background

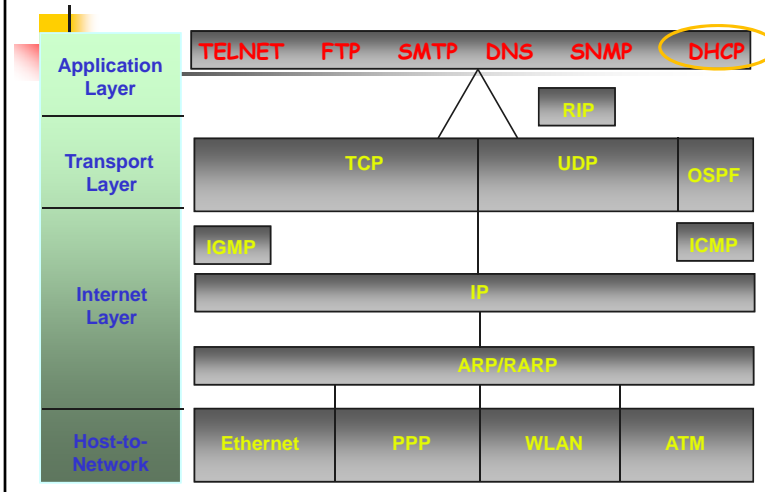

- Introduction of Internet
- TCP/IP and OSI/RM
- Sockets

Typical Internet Applications

- DNS (Domain Name System)
- DHCP (Dynamic Host Configuration Protocol)
- Remote Interactive Computing: TELNET/SSH
- File Transfer and Access: FTP/TFTP/NFS
- Email: SMTP/POP/IMAP/MIME
- World Wide Web: HTTP
- Network Management: SNMP
- Multimedia and Voice: SIP / H.323, RTP / RTCP

2

Protocols of Internet

Agenda

- Some useful information about learning a protocol
- Introduction to DHCP
- DHCP Protocol
- Examples about DHCP configuration

Refer to Chapter 22 of textbook

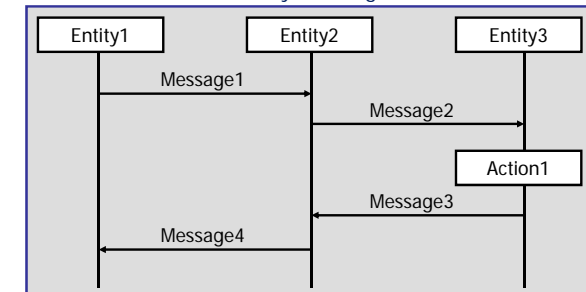

4

Some Useful Information About Learning A Protocol

5

MSC (1)

- Message Sequence Chart
- Define the message exchange sequences between different network elements to complete a specific function
- Basic format: network entity, message, action

6

MSC (2)

- A MSC example of telephone call set up

STD (1)

- State Transition Diagram
- Define the state transition relationship in a protocol
- The state transition may be triggered by an event or an incoming message, and may be together with an outgoing message
- Basic format: state, event, incoming message, outgoing message

8

STD (2)

- A STD example of telephone call set up of the caller

TLV

- Type-Length-Value
- A typical encoding style used in defining the areas with variable length in message
- Each item contains a *type* field, a *length* field, and followed by a *value* of the specified length
- Example

10

Introduction to DHCP

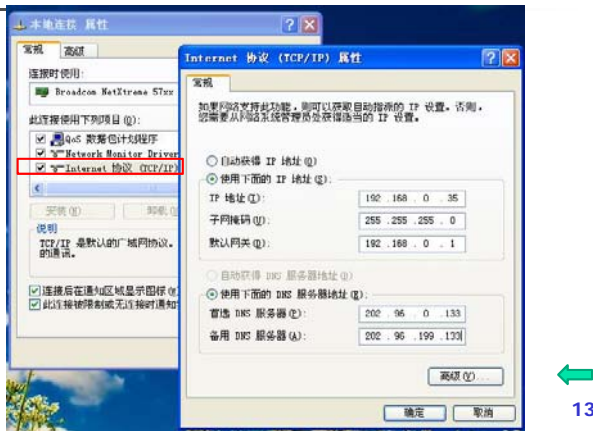

11

IP Address Allocation

- IP address management
 - Plan / recording / assignment / retrieval /renumbering
- Static allocation
- Dynamic allocation
 - BOOTP (BOOTstrap Protocol)
 - DHCP (Dynamic Host Configuration Protocol)

12

Static Allocation Example

13

What is BOOTP?

- Bootstrap Protocol
- used by a network client to obtain an **IP address** from a configuration server
- Used by diskless workstation to obtain **boot information** such as boot file name
- TFTP is used to transfer boot file
- originally defined in RFC 951

14

What is DHCP?

- Dynamic Host Configuration Protocol
- Provides **automatic configuration** of remote hosts
- An extension to **BOOTP**
- Using **UDP** as its transport protocol
- Following client-server paradigm
 - Using port 67 (for server) and 68 (for client)

15

DHCP Client & DHCP Server

- DHCP client
 - A DHCP client is an Internet host using DHCP to obtain configuration parameters such as a network address
- DHCP server
 - A DHCP server is an Internet host that returns configuration parameters to DHCP clients

16

DHCP Lease

- A **DHCP lease** is the amount of time that the DHCP server grants to the DHCP client permission to use a particular IP address
- A typical server allows its administrator to set the lease time
- The optimal time for a lease depends on the particular network and the needs of a particular host

17

DHCP Features

- *Simple administration*
 - **IP addresses**, **subnet masks**, and the **default gateway** do not need to be manually entered on every client machine
- *Moving machines*
 - When moving a machine to a different subnet, you simply move the machine and it acquires a new IP and subnet mask from the DHCP server on that subnet.
- *Eliminating erroneous IP information*
 - Taking the human factor out of the equation reduces problems, such as duplicate IP addresses
- *Eliminating additional configuration information*
 - WINS servers, **DNS servers**, and default gateways are some of the widely used configuration option settings possible with DHCP.
- *Efficient use of IP addresses*
 - DHCP can help make the best use of limited IP addresses. All available IP address are put into a **pool** and used by active clients. Machines that are inactive do not use an IP address.

18

DHCP vs. BOOTP - Similarities

- The **format structure** each uses to exchange messages
- Use of **well-known UDP ports** for client/server communication
- IP address distribution as an integral part of configuration service

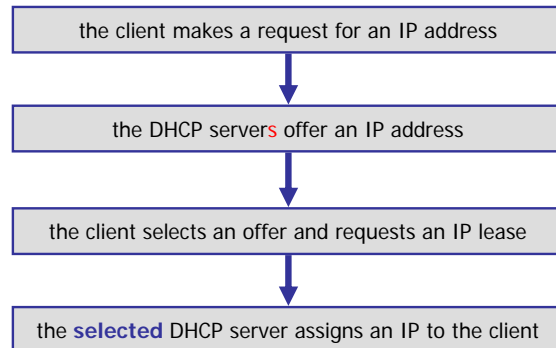

19

DHCP vs. BOOTP - Differences

- | | |
|--|--|
| <ul style="list-style-type: none"> ■ BOOTP <ul style="list-style-type: none"> ■ Prior to DHCP ■ Configure diskless workstations ■ Do not rebind or renew configuration | <ul style="list-style-type: none"> ■ DHCP <ul style="list-style-type: none"> ■ After BOOTP ■ Configure frequently relocated networked computers with local hard drives and full boot capabilities ■ Clients automatically enter a rebinding state at set timed intervals to renew their leased address allocation |
|--|--|

20

Phases of IP Assignment with DHCP

21

DHCP Protocol

22

Related RFCs (1)

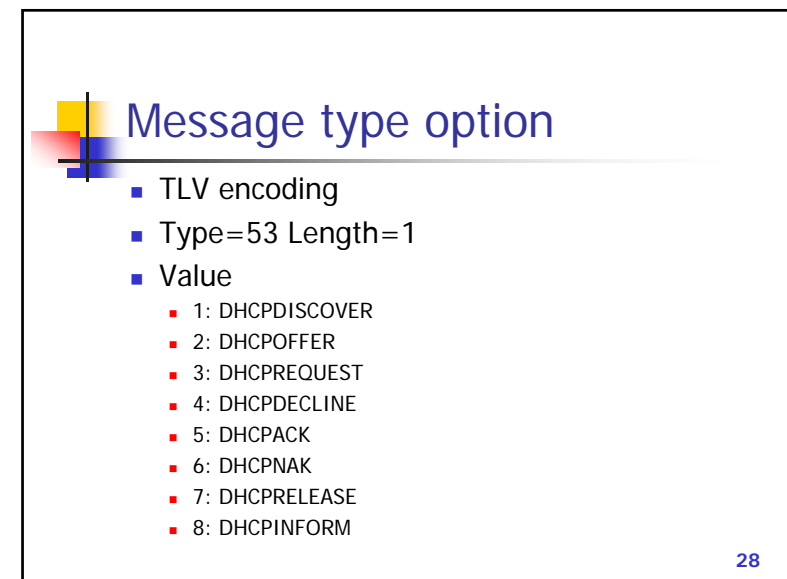

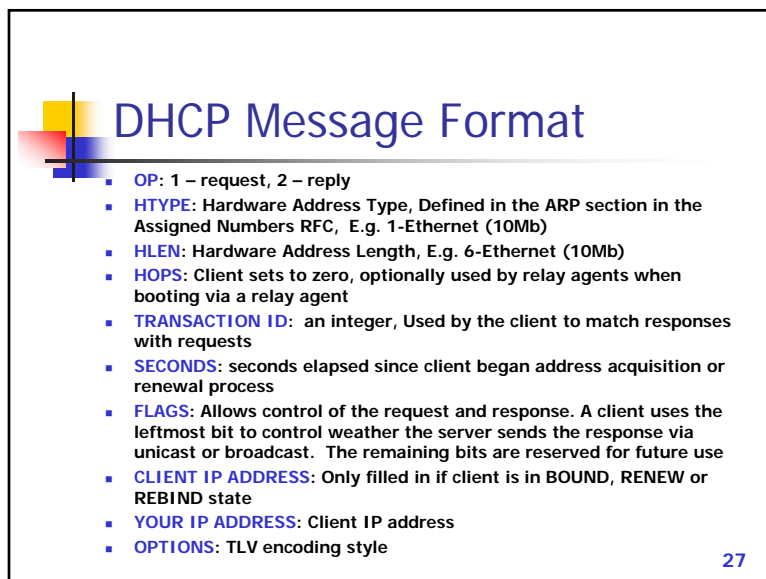

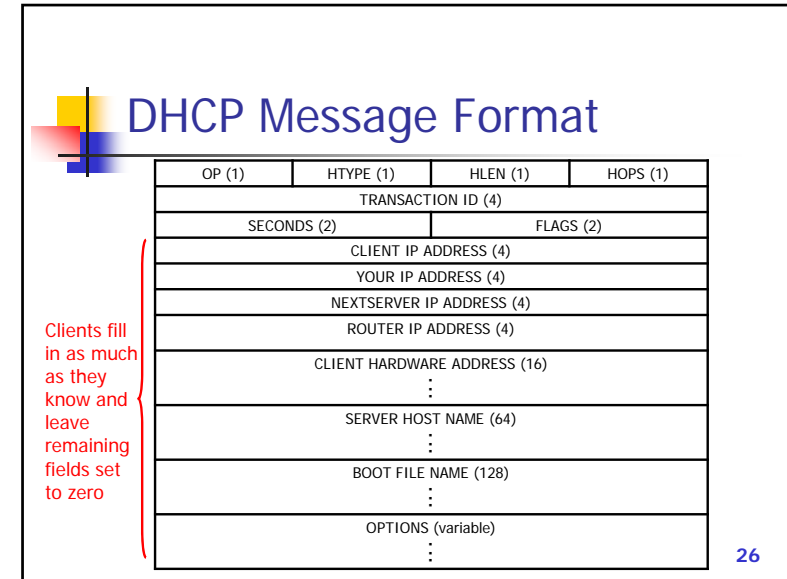

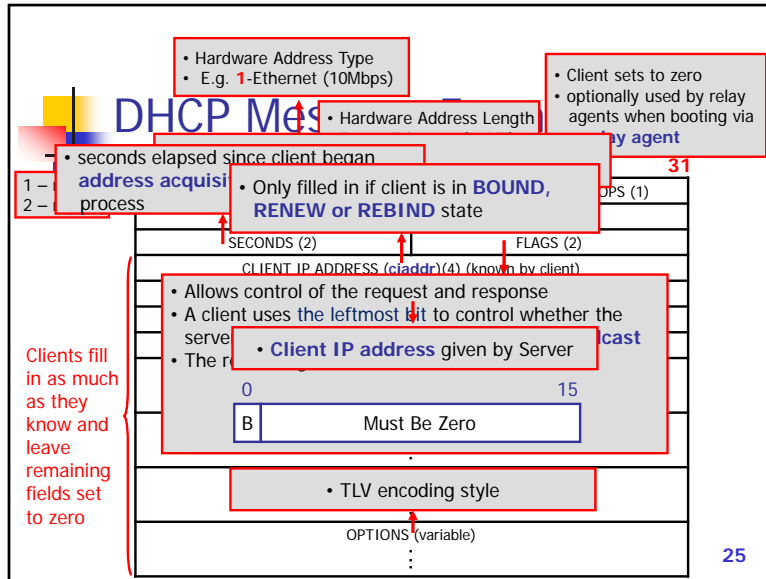

- BOOTP
 - RFC951
- DHCP Specifications
 - **RFC2131**, Dynamic Host Configuration Protocol (<- RFC1541<- RFC1531)
 - RFC3315, Dynamic Host Configuration Protocol for IPv6 (DHCPv6)
 - RFC3396, Encoding Long Options in the Dynamic Host Configuration Protocol (DHCPv4)
 - RFC4361, Node-specific Client Identifiers for Dynamic Host Configuration Protocol Version Four (DHCPv4)
- DHCP Options
 - **RFC2132**, DHCP Options and BOOTP Vendor Extensions (<- RFC 1533<- RFC1497, RFC1395, RFC1084, RFC1048)
 - RFC3442, The Classless Static Route Option for Dynamic Host Configuration Protocol (DHCP) version 4
 - RFC3942, Reclassifying Dynamic Host Configuration Protocol version 4 (DHCPv4) Options
 - RFC4833, Timezone Options for DHCP
- Interoperation between DHCP and BOOTP
 - **RFC1534**, Interoperation Between DHCP and BOOTP

23

Related RFCs (2)

- Others
 - RFC2485, DHCP Option for The Open Group's User Authentication Protocol
 - RFC2563, DHCP Option to Disable Stateless Auto-Configuration in IPv4 Clients
 - RFC2610, DHCP Options for Service Location Protocol
 - RFC2937, The Name Service Search Option for DHCP
 - RFC3004, The User Class Option for DHCP
 - RFC3011, The IPv4 Subnet Selection Option for DHCP
 - RFC3046, DHCP Relay Agent Information Option
 - RFC3118, Authentication for DHCP Messages
 - RFC3203, DHCP reconfigure extension
 - RFC3319, Dynamic Host Configuration Protocol (DHCPv6) Options for Session Initiation Protocol (SIP) Servers
 - RFC3361, DHCP-for-IPv4 Option for Session Initiation Protocol (SIP) Servers
 - RFC3397, Dynamic Host Configuration Protocol (DHCP) Domain Search Option
 - RFC3736, Stateless DHCP Service for IPv6
 - RFC4030, The Authentication Suboption for the DHCP Relay Agent Option
 - RFC4477, DHCP: IPv4 and IPv6 Dual-Stack Issues
 -

24

DHCP Messages (1)

- **DHCPDISCOVER** - Client broadcasts to locate available servers.
- **DHCPOFFER** - Server responses to DHCPDISCOVER with offer of configuration parameters.
- **DHCPREQUEST** - Client sends to servers either (a) requesting offered parameters from one server and implicitly declining offers from all others, (b) confirming correctness of previously allocated address after, e.g., system reboot, or (c) extending the lease on a particular network address.
- **DHCPACK** - Server responses with configuration parameters, including committed network address.

29

DHCP Messages (2)

- **DHCNACK** - Server to client indicating client's notion of network address is incorrect (e.g., client has moved to new subnet) or client's lease as expired.
- **DHCPDECLINE** - Client to server indicating network address is already in use.
- **DHCPRELEASE** - Client to server relinquishing network address and cancelling remaining lease.
- **DHCPINFORM** - Client to server, asking only for local configuration parameters; client already has externally configured network address. For example, it can be used to obtain tunnel endpoint address.

30

Major Operations in DHCP

- Address acquisition
 - Getting an IP address
- Early lease termination
 - Returning IP address before lease expires
- Lease renewal
 - Updating a lease

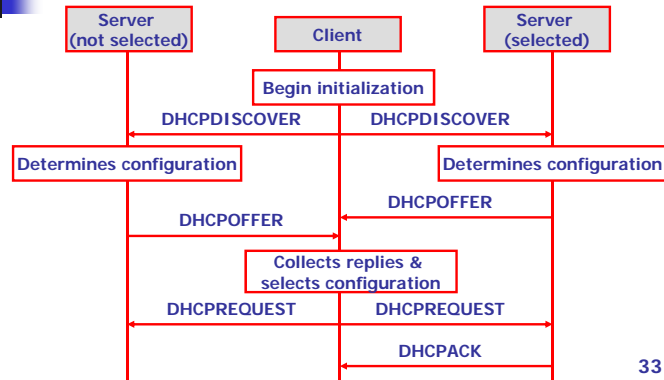

31

Address Acquisition: phases

- **IP lease request**
 - To boot up, the client sends a **DHCPDISCOVER** broadcast message, requesting the location of a DHCP server with IP address information
 - The DHCPDISCOVER packet is encapsulated in a UDP/IP packet and is sent to the local subnet broadcast address of 255.255.255.255
- **IP lease offer**
 - After requesting a lease, the DHCP client waits for a response and is said to be in a **SELECT** state
 - Any available DHCP servers with IP addresses to offer respond to the client request with a **DHCPOFFER** message
- **IP lease selection**
 - The client chooses one DHCPOFFER from all the offers it receives, regardless of which subnet the DHCP server is located in
 - The client then sends a broadcast **DHCPREQUEST** message, requesting a lease
- **IP lease acknowledgment**
 - The DHCP server that made the offer responds to the client with a **DHCPACK** message while any other DHCP servers that made an offer withdraw
 - The IP address is assigned to the client

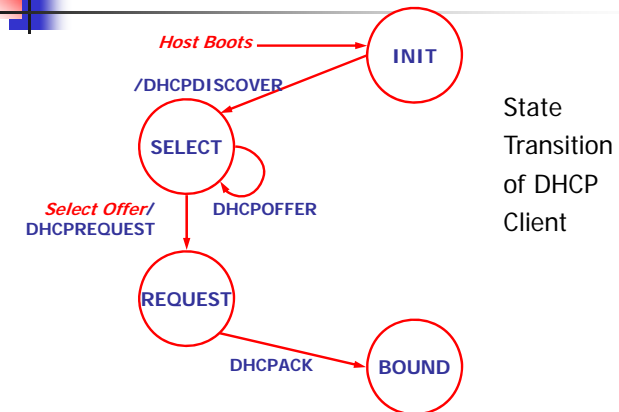

32

Address Acquisition: MSC

33

Address Acquisition: STD of the client

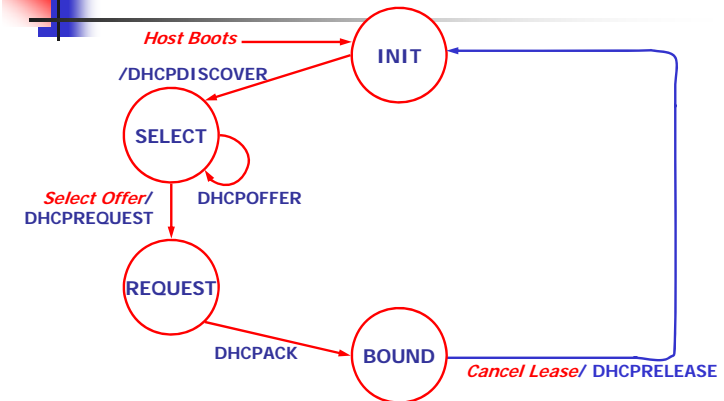

34

Early Lease Termination: MSC

35

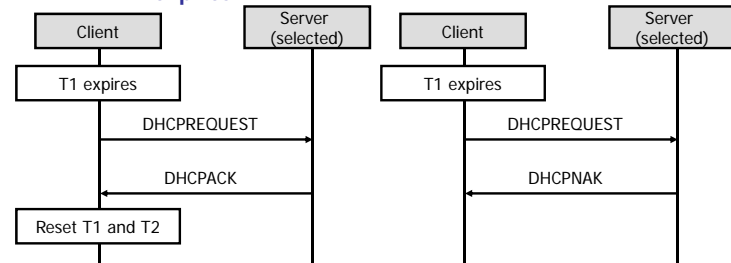

Early Lease Termination: STD of the client

36

Lease Renewal: MSC(1)

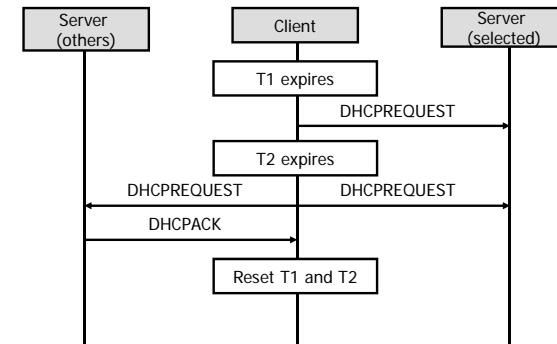

T1 expires

- **T1**: the time at which the client enters the **RENEW** state and attempts to contact the server that **originally issued** the client's network address
 - $0.5 * \text{duration_of_lease}$
- **T2**: the time at which the client enters the **REBIND** state and attempts to contact **any** server.
 - $0.875 * \text{duration_of_lease}$

Lease Renewal: MSC(2)

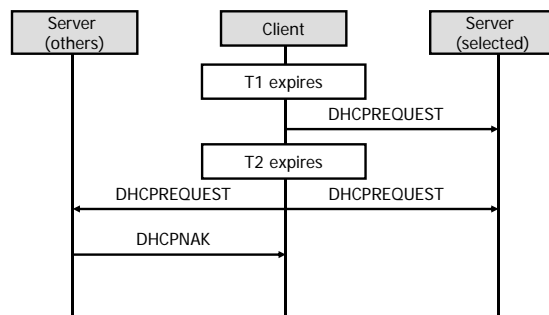

Both T1 and T2 expire, address rebound

38

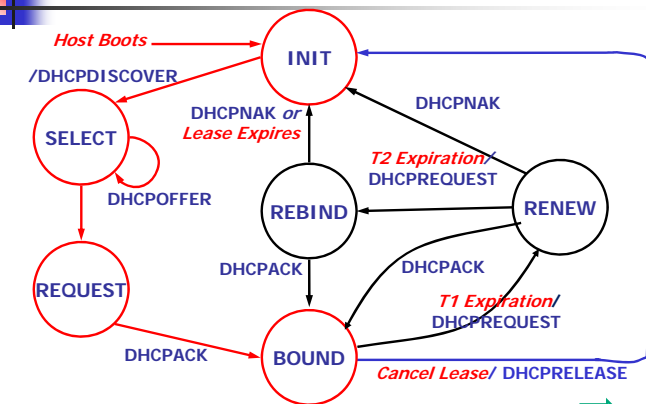

Lease Renewal: MSC(3)

Both T1 and T2 expire, request refused

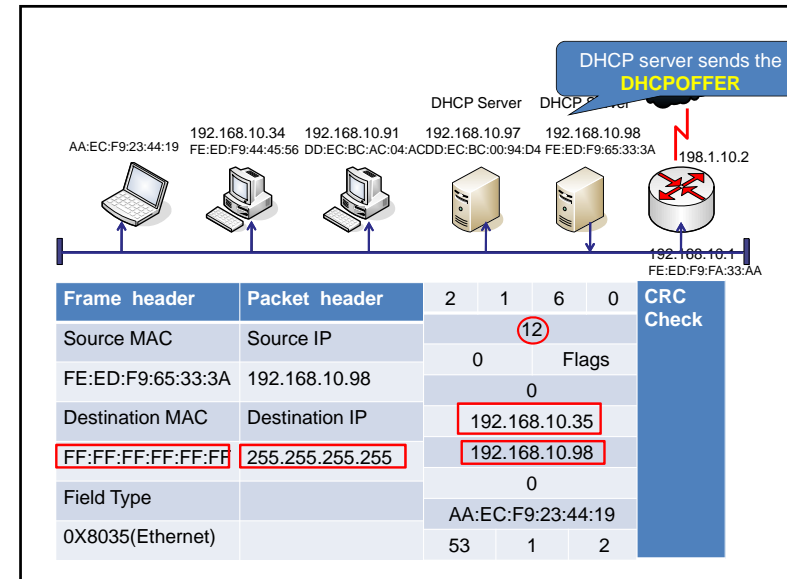

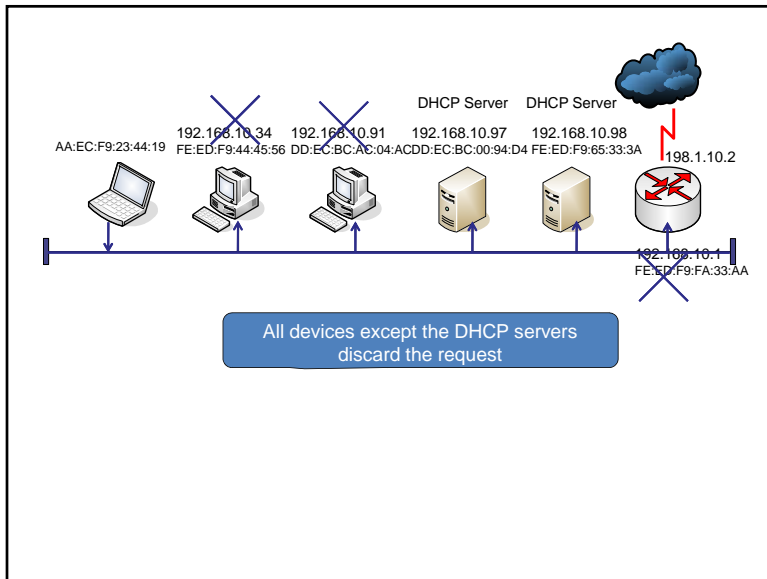

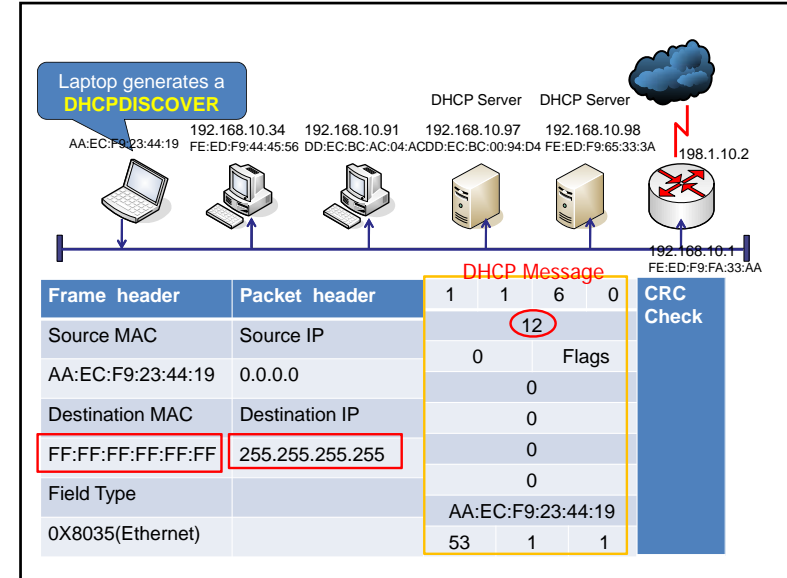

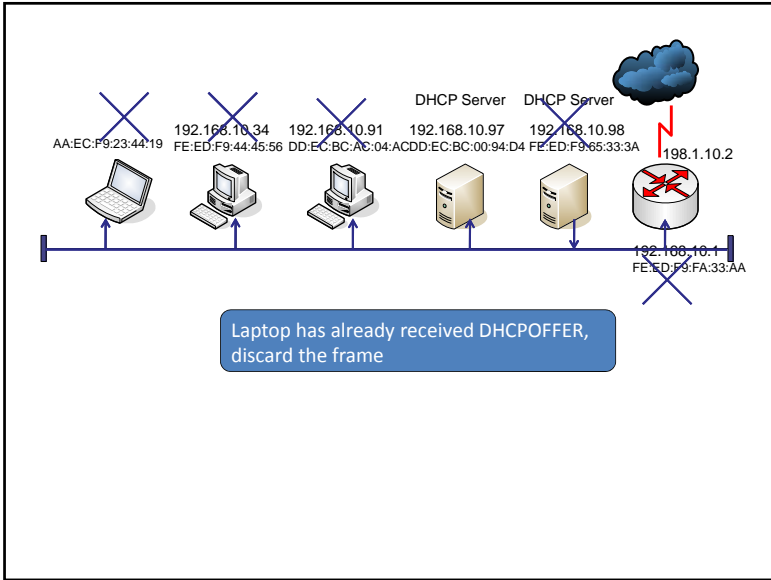

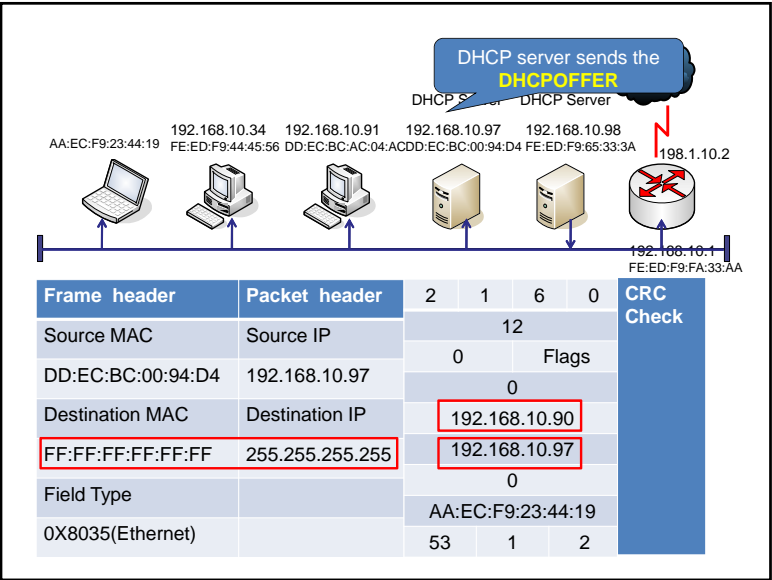

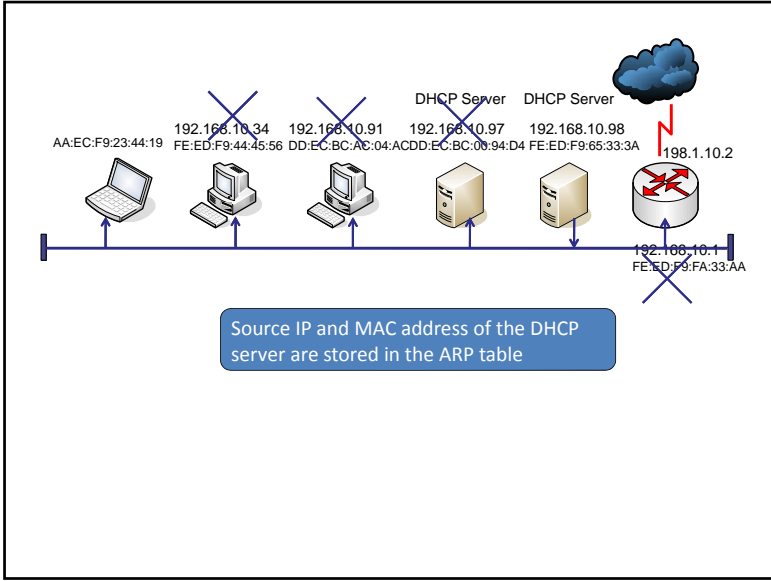

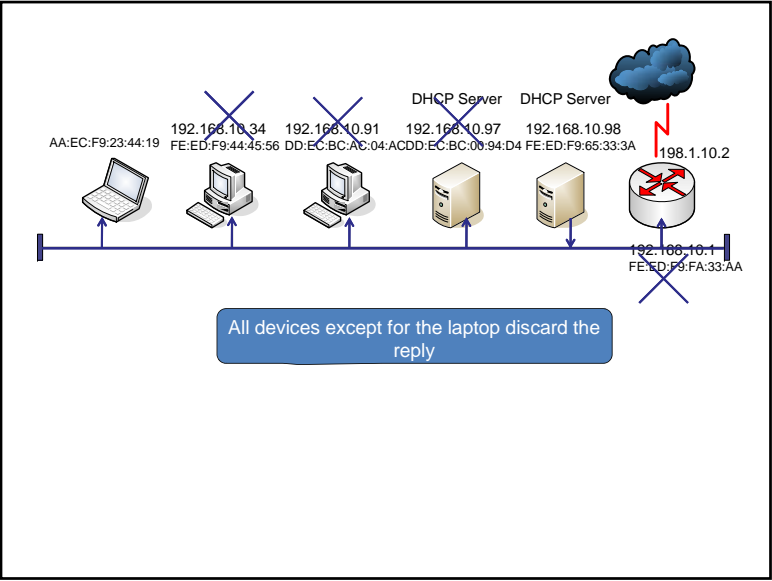

39

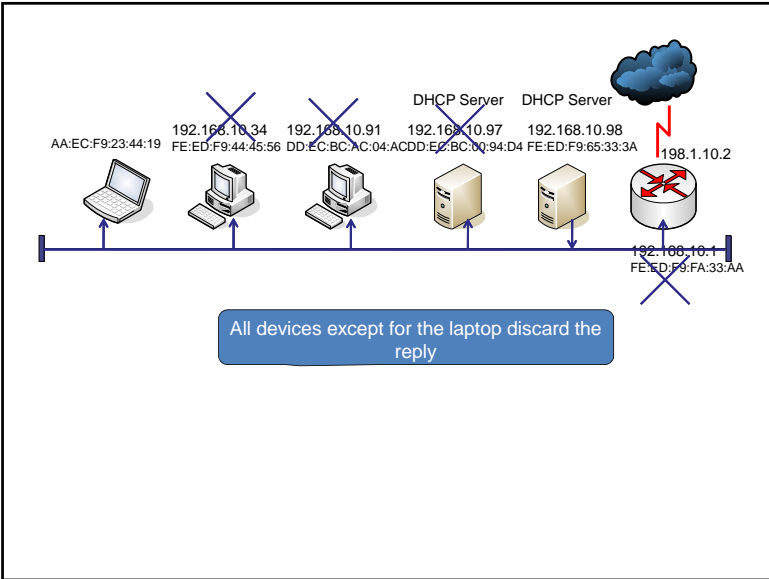

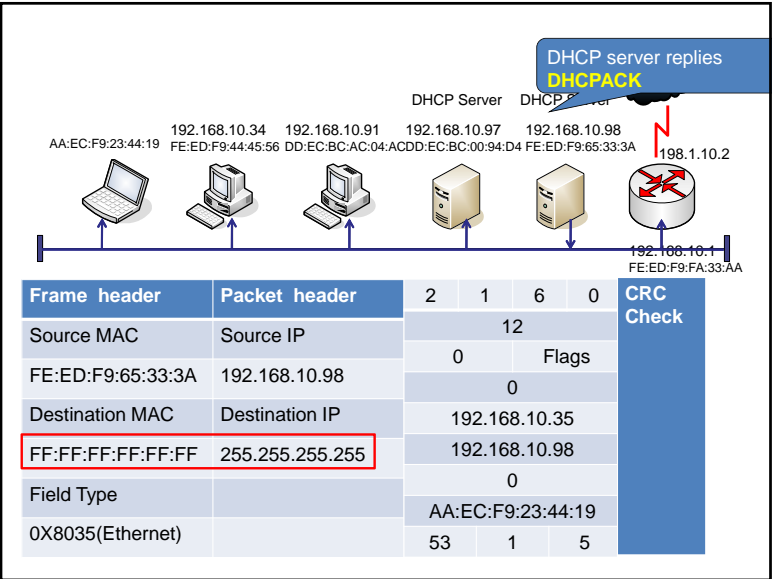

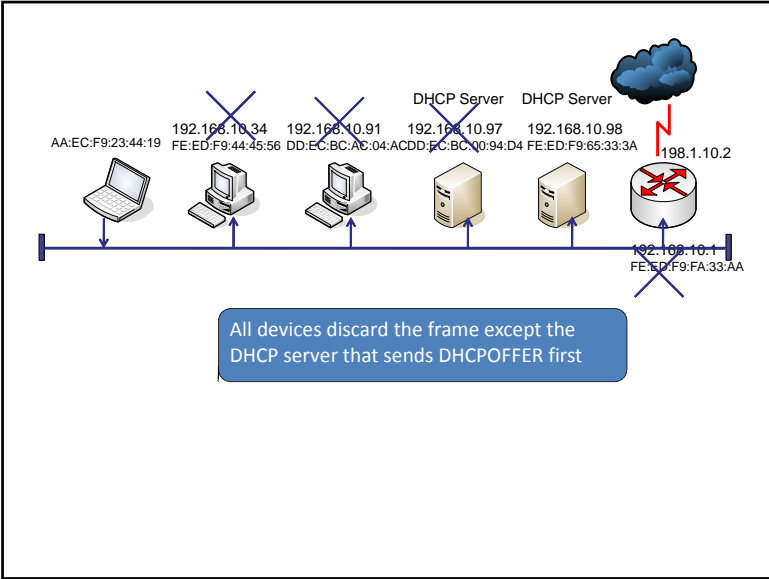

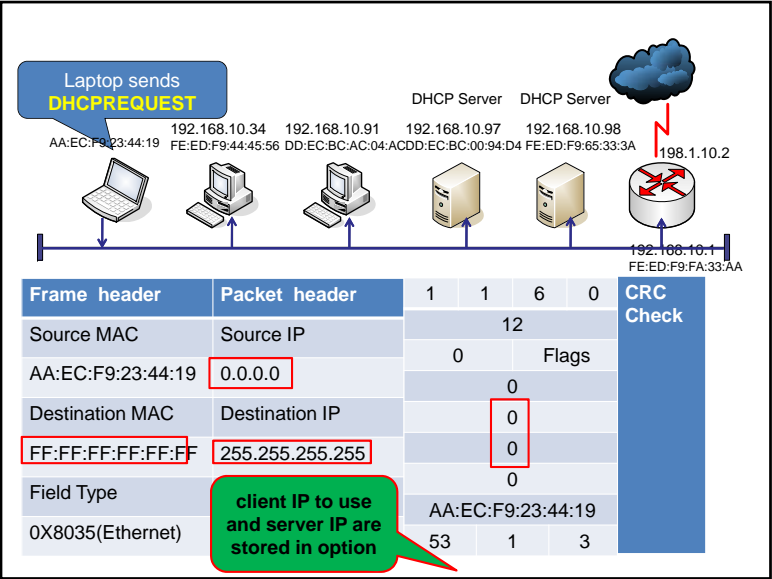

Lease Renewal: STD of the client

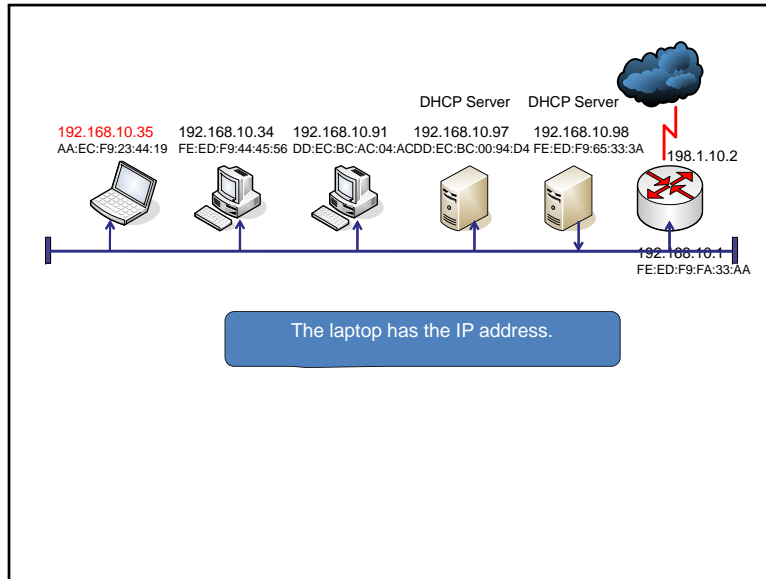

40

Multicast address allocation

- MADCAP
 - Multicast Address Dynamic Client Allocation Protocol
- Used for conferencing and audio
- The multicast address allocation features
 - A MADCAP server, which distributes multicast addresses
 - MADCAP clients can use client-side APIs to request, renew or release multicast address

54

DHCP client alternate configuration

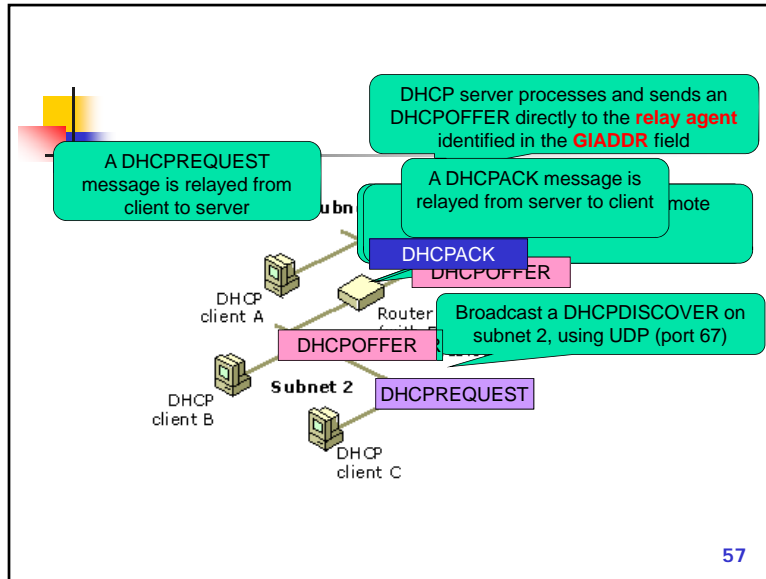

- Static IP address configuration
- Dynamic IP address configuration without alternate configuration
- Dynamic IP address configuration with alternate configuration
 - User can move the computer between one statically configured network (Such as home network) and one or more dynamically configured networks without changing any settings.

55

DHCP Relay

- Used to interconnect hardware and software on **different** physical network segments called **subnets** and **forward** IP packets between each of the subnets.
- **Router** must comply with **DHCP/BOOTP relay agent** capabilities.
- A **computer** that can function as a relay agent if router cannot function as a relay agent.

56

Security Problems

- Built on UDP and IP
 - Inherently insecure
- DHCP is an unauthenticated protocol
- Denial-of-service attacks against the DNS server can be made through the DHCP server
- Unauthorized, non-Microsoft DHCP servers can lease IP addresses to DHCP clients

58

Recommendations

- Ensure that unauthorized persons do not have physical or wireless access to your network.
- Enable audit logging for every DHCP server on your network. Regularly check audit log files, and monitor them when the DHCP server receives an unusually high number of lease requests from clients.
- Use the DHCP audit logs to monitor DNS dynamic updates by the DHCP server.

59

Examples of DHCP Configuration

60

Examples of DHCP Configuration (1)

- Installation and configuration of DHCP server in Windows 2000 Server
 - <http://www.qqread.com/network/server/q580178181.html>
- Installation and configuration of DHCP server in UNIX/LINUX
 - DHCP server configuration file: `/etc/dhcpd.conf`
 - DHCP Lease information file: `/var/lib/dhcp/dhcpd.leases`
 - <http://www.qqread.com/linux/2006/08/e802195061.html>
 - <http://www.qqread.com/linux/2006/10/e241268.html>

61

Examples of DHCP Configuration (2)

- Configuration of DHCP server in a router (NU-MH300)

The screenshot shows a web-based configuration interface for a DHCP server. At the top, there are fields for 'IP地址' (IP Address), '子网掩码' (Subnet Mask), '网关地址' (Gateway Address), and '域名' (Domain Name). Below these, there are checkboxes for '启用DHCP服务器' (Enable DHCP Server) and '自动获取 DNS' (Automatic DNS). The 'DNS' section includes fields for 'DNS服务器 1' and 'DNS服务器 2'. The 'VLAN' section includes fields for 'VLAN服务器 1' and 'VLAN服务器 2'. The '内部网络接口地址' (Internal Network Interface Address) section includes fields for '用户IP地址范围1' and '用户IP地址范围2'. The '租用时间' (Lease Time) section includes a field for '租用时间' (Lease Time) with a value of 2400 hours.

62

Summary of DHCP

- DHCP vs. Bootp
- DHCP Server, DHCP Client
- DHCP Lease
- Phases of IP assignment
- DHCP operations
 - Address acquisition(MSC)
 - Early lease termination
 - Lease renewal
- DHCP Relay

63
